

“Piecing digital evidence together”

Secure Data Destruction

Conscientious disposal of hard drives and other media can often prove expensive and time consuming. Aside from consuming internal resources, drive destruction and their subsequent disposal often requires the services of 3rd party companies.

Drive destruction is not environmentally friendly as no resources are reclaimed. In order for hard drives to be reused safely their entire content needs to be securely deleted. This deletion process is achieved by overwriting the data on the hard drive. Often data is too sensitive for Logical Destruction alone and requires Physical Destruction.

- **Logical Destruction**

IntaForensics provides a logical destruction of data by overwriting every sector of the media with a random binary pattern that is compliant with US Department of Defence DOD 5220.22-M. This technique guarantees that no data can be recovered by either a member of the public or by a commercial enterprise using Forensic data recovery.

- **Physical Destruction**

Any drives that cannot be overwritten due to physical errors or damage are placed through a NATO and SEAP (Security Equipment Assessment Panel) approved Degausser. The Degausser has been approved by the Government for the secure erasure and destruction of information and data stored on magnetic media up to TOP SECRET level. On completion the media will be stripped, physically destroyed and certified.

- **Fixed Costs**

- **Compliant with WEEE Directive on Waste Management**

- **Guaranteed Secure Data Destruction**

- **Nationwide Collection**

- **BS EN ISO 9001:2000 Accredited**
